Child passengers ages 1-5 injured or killed in motor vehicle crashes ⁹	Per 100,000 population 1-5	2007-09		362	437.1	322.7

Notes

Population - Rates calculated using July 1 population estimates from the Florida Legislature, Office of Economic and Demographic Research. The population data for 2001-2010, along with rates affected by the population data, has been updated on Florida CHARTS. Following a census, it is customary to revise population projections for the intercensal years based on information from the latest census. Revising the population data from what was predicted to actual estimates ensures accurate accounting of the racial, ethnic, and gender distribution of the population. These changes affect the population data and rates calculated for your community.

Year - Time periods include single calendar years (ex. 2006) and three-year averages (ex. 2004-06).

Quartiles - Quartiles in this report allow you to compare health data from one county to another in the state. Quartiles are calculated by ordering a rate from most favorable to least favorable by county and dividing the list into 4 equal-size groups. In this report, a low quartile number (1) always represents more favorable health situations while fours (4) represent less favorable situations. Blanks in this column indicate that not enough data was available to calculate a quartile or that a quartile calculation was not appropriate (i.e. population counts).

Counts - Counts for indicators displaying a 3-year rate are an average count of events over 3 years, NOT a sum. Blank spaces in this column indicate that no count is available for the indicator. A count of "<2" indicates an average of less than 2 events per year over a 3 year period.

Rates - Rates are frequently used when numbers are too small to use percent (per 100). For example, Florida's birth rate of 4.8 per 1000 females over age 35 would be the same as saying that 0.48% of females over age 35 had babies. Rates are typically expressed per 1000, per 10,000 or per 100,000, depending on how rare an event is. Rates based on fewer than 5 events over a 3 year period are marked as unstable (U). When the rates are based on only a few cases or deaths, it is almost impossible to distinguish random fluctuation from true changes in the underlying risk of disease or injury. Therefore comparisons over time or between communities that are based on unstable rates can lead to erroneous conclusions about differences in risk which may or may not be valid.

 Indicates that there is no data for the specified cell.

¹The Census Bureau defines a linguistically isolated household as one in which no one 14 years old and over speaks only English or speaks a non-English language and speaks English "very well". In other words, all members of the household 14 years old and over have at least some difficulty with English.

²Emergency Medicaid covers deliveries of pregnant aliens (non-US citizens).

³Includes women with reported cases of chlamydia, gonorrhea, and infectious syphilis.

⁴Underweight = BMI of 18.5 or less.

⁵Overweight = BMI between 25.0 and 29.9.

⁶Obese = BMI of 30 or more.

⁷May underestimate actual percent of births paid for by Medicaid.

⁸Hospital/ER treated includes both hospital inpatient and Emergency Department treatment.

⁹Event count includes crashes in Florida, regardless of residence of the driver. Denominator is Florida resident population.

¹⁰Rate not available for all counties.
